

## Piano sounds like an electronic organ

Looking like a couple of many-legged crawlers, these electronic feelers turn an ordinary piano into an organ merely by resting on the keys at the back. As a key is pressed, a spring-loaded plunger drops, closing a switch and sounding a corresponding electronic tone through an amplifier. The note plays as long as the key is held down, giving the normally short piano tone a rich, sustained organ sound. Piano-Mate was invented by Dubreq Studios, London.
