

It feels what you play, so you can play what you feel!

Feel the keyboard that feels your fingers. The Multimoog. It's a new synthesizer for the composer in you. And a new keyboard for the performer in you. And each key lets you touch a new dimension you've never felt from a keyboard before — expression.

Keys on most conventional keyboards are like on-off switches. When a key reaches bottom, the sound just sits there. So there's no room for expressing the sounds of a stretched guitar string, a bending saxophone reed, or a soaring violin vibrato.

But now you can put feeling into your performance with the Multimoog's force sensitive keyboard. You can actually guide the sound with the force of your fingers. Create vibratos, trills, or sample and hold. The keys actually feel how much expression you want to give.

While your right hand's playing what it takes two hands to play on other synthesizers, your left

Keys perform like standard keyboard until they meet force sensor mechanism.

Force sensor mechanism translates amount of pressure into amount of expression.

can add a third hand to the sound. Move the music several directions by moving the modulation wheel. Or slide the pitch with the slide of your finger on the ribbon controller.

With all this action at your fingertips, you could almost forget there's a fully variable synthesizer in front of you. Multimoog lets you conduct your sound with two audio oscillators plus a low frequency oscillator, fully variable wave shaping, a long $3\frac{1}{2}$ octave keyboard, single or multiple triggering. And more. Not to mention that famous fat Moog sound.

And thanks to Moog's philosophy, the music is never a side effect of the sound effects. The entire layout reads like a musical composition. With controls you can get your hands on. After all, sound isn't music unless you can play it.

Stop turning the notes on and off, and start playing them. Touch the sound of the Multimoog at your nearest Moog dealer. And discover just how good music can feel.
